

Should I download alpha versions? How do I download alpha versions?

The alpha versions are the most recent development versions of the modules which may or may not be stable. If you want the latest and greatest features and bug fixes, go ahead and grab the alpha versions. If you want the most stable versions, stick to the release versions. If you have Curse Client, you can download alpha versions by simply right clicking on the addon in your Curse Client and under "Add-on Type", switch to "Alpha". To manually download alpha versions, find the project on [CurseForge](#) and go to the "Files" tab.

IMPORTANT: Do not mix alpha and release versions. If you are using an alpha for one module, use the latest alpha for ALL modules (and the core TSM addon of course). In some cases, the release version of a module may be the latest version, in which case it may be mixed with alpha versions of other modules.
